Gadfly:

Dr Cate Jenkins is the foremost expert on concrete dust. She retired from the EPA several years ago. Here is some good information on concrete dust. On page 38 they even have a picture of and made reference to implosions. Basically concrete dust is very caustic. It's even more caustic than Drano. I can't believe in light of all the current studies the Health Director would say concrete dust doesn't present any problems. There's 33,000 cases of cancer caused by the dust from the WTC collapse. Many of them form a one-time exposure to the dust. Here's some interesting info on the subject.
