

Non-profit food waste creating energy could be a driver for changing minds

The Bethlehem Gadfly Climate Action Plan, Environment, Environmental Advisory Council, Serious Issues February 5, 2019

My hint was that Bethlehem build and fuel its own plant, not feed Easton's I apologize for my lack of clarity. I am aware that we live in a wonderful yet somewhat backward place where services like city-provided garbage pickup in fixed routes with automated trucks doesn't happen. We don't have self-check machines at our main circulation desk at our library, etc. What we *do* have are big non-profit organizations who often cooperate for the good of the city in which they operate.

I admire the work that Peter and his colleagues are doing to fight the good fight for our region and the world. Non-profit food waste creating energy for the betterment of the entire city could be a driver for changing the minds of more taxpayers, and sooner rather than later.
